## Introduction

### About This Document

This document is reference document and usage instructions for FT.S-GPIO tell intended for Compulab Tensor line of add on boards.

### Product description

Based on STM32F Cortex M0 CPU, Emulates COM port and enables the user to control routed GPIO's.

## Overview

### Highlights

- Implementation of USB to GPIO without the need for special drivers or deep system knowledge.
- Enables fast prototyping and fast time to market.
- Can be used with popular coding language's like Python
- Open software and Hardware for even more flexibility
- Build in bidirectional isolation based on ADM3260 chip.
- Build in 4 Isolated GPIO's expandable up to 20 with FT.V-TERM4

### Software

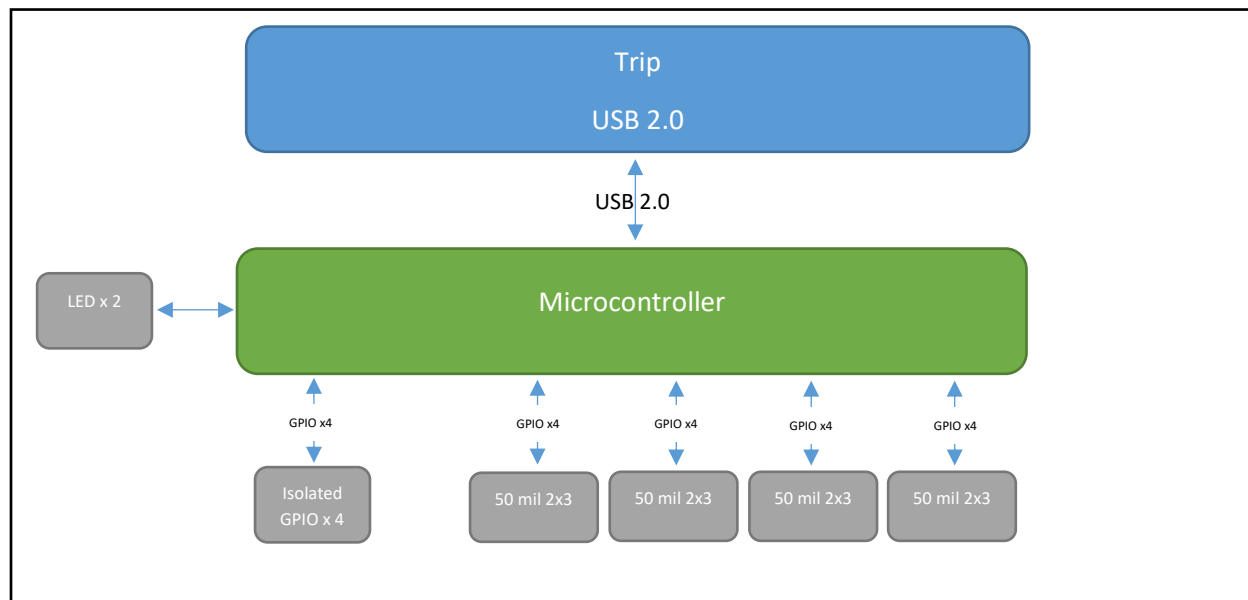

Software based on Mbed OS 5, Binary and source is available here:

[https://github.com/Andrew-tesler/FT.S\\_GPIO](https://github.com/Andrew-tesler/FT.S_GPIO)

### Hardware

Schematics and Gerber files are available in the GitHub Repository.

## Block Diagram

## Usage instructions

### GPIO table

| Signal Name (SW) | Pin # (MCU) | Type       | Description        |
|------------------|-------------|------------|--------------------|
| GPIO_1           | PA0         | I/O GPIO   | On Board I/O GPIO  |
| GPIO_2           | PA1         | I/O GPIO   | On Board I/O GPIO  |
| GPIO_3           | PA2         | I/O GPIO   | On Board I/O GPIO  |
| GPIO_4           | PA3         | I/O GPIO   | On Board I/O GPIO  |
| GPIO_5           | PA4         | I/O GPIO   | Extension I/O GPIO |
| GPIO_6           | PA5         | I/O GPIO   | Extension I/O GPIO |
| GPIO_7           | PA6         | I/O GPIO   | Extension I/O GPIO |
| GPIO_8           | PA7         | I/O GPIO   | Extension I/O GPIO |
| GPIO_9           | PA8         | I/O GPIO   | Extension I/O GPIO |
| GPIO_10          | PA9         | I/O GPIO   | Extension I/O GPIO |
| GPIO_11          | PA10        | I/O GPIO   | Extension I/O GPIO |
| GPIO_12          | PA15        | I/O GPIO   | Extension I/O GPIO |
| GPIO_13          | PB0         | I/O GPIO   | Extension I/O GPIO |
| GPIO_14          | PB1         | I/O GPIO   | Extension I/O GPIO |
| GPIO_15          | PB2         | I/O GPIO   | Extension I/O GPIO |
| GPIO_16          | PB3         | I/O GPIO   | Extension I/O GPIO |
| GPIO_17          | PB4         | I/O GPIO   | Extension I/O GPIO |
| GPIO_18          | PB5         | I/O GPIO   | Extension I/O GPIO |
| GPIO_19          | PB6         | I/O GPIO   | Extension I/O GPIO |
| GPIO_20          | PB7         | I/O GPIO   | Extension I/O GPIO |
| LED1             | PB14        | LED(Green) | On board LED       |
| LED2             | PB15        | LED(Green) | On board LED       |

## Usage

Each GPIO can be programmed for Output or input direction.

- Output - The GPIO Can be controlled for High or LOW output state.
- Input - The user can read if the GPIO is now in HIGH state or LOW, state.

Note: GPIO initial state is Output low.

## Commands table

| Command | Description  | Notes |
|---------|--|-------|
| #n      | Set "n" GPIO High or low                                 |       |
| @n      | Set "n" GPIO direction Input Output                      |       |
| \$n     | Read "n" GPIO state (High or Low, for Input direction)*1 |       |

\* 1. If command issued on Output GPIO, Programed state will be returned

## Using FT.S-GPIO Windows

### Using FT.S-GPIO from Terminal

- Open a terminal utility program Like [Tera Term](#) or [Putty](#).
- Establish new connection to the serial port assigned to FT.S-GPIO (In TeraTerm -> New connection -> Serial (Select COMn USB device))
- Type a command

Note: There is no command editing (No Backspace / delete). If you mistype press enter and start new command.

### Using FT.S-GPIO from command line

```
echo [command] > \\.\[com port]
```

- [command] - the command sent to fit-statUSB over serial
- [com port] - the COM port assigned to fit-statUSB

**Example:** Assuming fit-statUSB is on COM10 the following command will set fit-statUSB color to red:

## Power shell

```
powershell "$fitstatUSB= new-Object System.IO.Ports.SerialPort [com port];  
$fitstatUSB.open(); $fitstatUSB.WriteLine('[command]');  
$fitstatUSB.Close() "
```

- [command] - the command sent to fit-statUSB over serial

- [com port] - the COM port assigned to fit-statUSB

**Example:** Assuming fit-statUSB is on COM10 the following command will set fit-statUSB color to red:

```
powershell "$fitstatUSB= new-Object System.IO.Ports.SerialPort COM10;
$fitstatUSB.open(); $fitstatUSB.WriteLine('#FF0000'); $fitstatUSB.Close() "
```

#### Locating com port

- Open device manager
- Open ports tab
- find **USB to COM**, add Picture and notation what to look for

#### Using FT.S-GPIO Linux

##### Using FT.S-GPIO from Terminal

- Install your favorite terminal application (Minicom, Kermit....)
- Establish new connection

##### Using FT.S-GPIO from Command Line

##### Detect FT.S-GPIO Serial Port

- Run dmesg command (Some distro will require sudo)
- Locate Product string "FT.S-GPIO"
- Locate assigned TTY port

#### Sample Python Code

Note: Python dependencies: pyserial

```
import serial

ser = serial.Serial("/dev/ttyACM0")
ser.write(b"B#FF0000-500#00FF00-500#0000FF-500\n")
ser.close()
```

## Troubleshooting's Common problems
